

At PROZPARITY, we design markets for distributed energy to make your energy greener and cheaper.

Prozparity

The decentralized energy trading platform for China

Our Team

Together, we combine long-term entrepreneur experience and academic research.

We're dedicated to find the best solution for you. With ambitious targets, but always down-to-earth.

With our diverse backgrounds in the energy sector, we have a deep understanding for innovations and digitalization in China's energy transition.

By building a trading platform and managing the data of each transaction, we reduce the costs for grid companies, create revenues for distributed energy owners, and reduce electricity cost for energy consumers.

Policy Environment in China

As refer to NDRC-NEA documents [2017]1901 and [2019]594, Distributed Energy Trading is highly supported by government, to encourage local consumption and clean energy utilization; besides, grid parity is the trend in Chinese energy sector that subsidies for energy project owners are gradually reducing.

Clean, affordable and safe

Our core solution is a tailored electricity market design that optimizes energy consumption behavior through electricity prices and creates incentives to invest into distributed energy, while building a greener environment.

Key Offerings

- customized energy market designs
- user-friendly interface
- big-data center
- data management, to track energy flows, financial benefits, consumption patterns and many more functions

Key Clients

- Local grid companies
- Energy consumers (especially high energy-intensity industries)
- Distributed energy owners
